$Q$: sum over the moments in the objective of the weighted squared deviation $(\text{model} - \text{data})^2/(\text{s.e.}^2 + \text{var}_{sim})$ (diag_noise weights). Moments outside the objective have zero weight.

Standard errors: sandwich $(G'WG)^{-1}G'W\Omega WG(G'WG)^{-1}$ with the bootstrap covariance of the targets plus the simulation covariance ('fixed': not free in the run). Units as in Table **??**.
