Targets: the model's moments at the truth (CRN seed 20261018); start: truth perturbed by $N(0, 0.5)$ in logistic units. z = (recovered − truth) / s.e.; noise s.e. = simulation noise only, data s.e. = sandwich with the bootstrap covariance of the targets plus simulation noise. Within 2 noise s.e.: 3 of 19; within 2 data s.e.: 8 of 19. Best Q 481.8. Run `recovery_closed_20261018_151959`.
